## How to use a Graphing Calculator to Solve a System of Equations

A system of equations is a set of two or more equations with the same unknown variables. This handout will cover how to solve a system of equations with the TI-84 calculator by graphing, using the graph table, and using a matrix. The following image identifies important buttons that will be needed.

## Solve by graphing the functions

The graphing method for solving systems of equations uses the graph intersect function. This method can only be used for equations with two variables. The solutions for this method are displayed visually on the graph.

- Begin by rearranging the equations to be in the form of $y=$ :

$$
\left\{\begin{array} { l } 
{ y + x = 7 } \\
{ y - 1 = 2 x }
\end{array} \longrightarrow \left\{\begin{array}{l}
y=-x+7 \\
y=2 x+1
\end{array}\right.\right.
$$

- Press the $\mathbf{y}=$ button on the calculator to open the function window.

| Plot1 | Plot2 | Plot3 |
| :---: | :---: | :---: |
| - $\mathrm{NY}_{1}=$ |  |  |
| $\mathrm{NY}_{3}=$ |  |  |
|  |  |  |
| - $\mathrm{Y}_{5}=$ |  |  |
| - $\mathrm{Y}_{6}=$ |  |  |
| -1Y\% |  |  |

- Enter the first equation into " $\mathrm{Y}_{1}$ " and use the $\mathbf{X}, \mathbf{T}, \boldsymbol{\theta}, \mathbf{n}$ button when the variable is needed. Press enter or use the navigation arrows to move from one equation to the next.
- Enter the second equation into " $\mathrm{Y}_{2}$."

| Plot1 Plot2 <br> Plot3  |  |
| :---: | :---: |
|  |  |
| 1- $\mathrm{Y}_{2}$ 日 $2 \mathrm{X}+1$ |  |
| - $\mathrm{Y}_{3}$ = |  |
| -1Y4 $=$ |  |
| -1Y5 ${ }^{\text {a }}$ |  |
| - $\mathrm{Y}_{6}=$ |  |
| -VYァ= |  |

- Press graph.

- It may be necessary to zoom in or out of the graph window to see the intersection. To do this, press Zoom and then either select "2: Zoom In" or "3: Zoom Out." Use the navigation arrows to move the cursor to the intersection and press enter.
- The view of the graph can also be changed by pressing window and changing the "xmin," "xmax," "ymin," and "ymax" values.
- Press 2nd then trace to pull up the graph calculate window.
- Use the navigation arrow keys to select the " 5 : intersect" function and press enter.

- Press enter 3 times until the screen displays the coordinates of intersection closest to the cursor.
- If there is no intersection, there is no solution.
- For systems with multiple intersections, follow the steps above to reselect the " 5 : intersect" function. Use the arrow keys to move the cursor close to the second intersection and then press enter 3 times.
- The $x$ and $y$ coordinates of the solution will be displayed at the bottom of the screen.

## Solution:

$$
x=2 \quad y=5
$$

## Solve by using the graph table

Similar to the first method, using the graph table to solve the system of equations only works for systems with two variables. Furthermore, this method only works for solving systems with whole number solutions.

- Arrange the equations to be in the form of $y=$ :

$$
\left\{\begin{array} { l } 
{ y + x = 7 } \\
{ y - 1 = 2 x }
\end{array} \longrightarrow \left\{\begin{array}{l}
y=-x+7 \\
y=2 x+1
\end{array}\right.\right.
$$

- Press the $\mathbf{y}=$ button on the calculator to open the function window.

| Plot1 | P1ot2 | Plot3 |
| :---: | :---: | :---: |
| - $\mathrm{Y}_{1}=$ |  |  |
| - $\mathrm{YY}_{2}=$ |  |  |
| - $\mathrm{Y}_{3}=$ |  |  |
| - $\mathrm{Y}_{4}=$ |  |  |
| - $\mathrm{Y}_{5}=$ |  |  |
| - $\mathrm{Y}_{6}=$ |  |  |
| - $\mathrm{VY}_{7}=$ |  |  |

- Enter the first equation into " $\mathrm{Y}_{1}$ " and use the $\mathbf{X}, \mathbf{T}, \boldsymbol{\theta}, \mathbf{n}$ button when the variable is needed.
- Enter the second equation into " $\mathrm{Y}_{2}$."

| Plot1 Plot2 | Plot3 |
| :---: | :---: |
| - YY $_{1} \mathrm{E}-\mathrm{X}+7$ |  |
| - Y $_{2} \mathrm{~B} 2 \mathrm{X}+1$ |  |
| -1 $\mathrm{Y}_{3}=$ |  |
| - $\mathrm{Y}_{4}=$ |  |
| - $\mathrm{Y}_{5}=$ |  |
| - $\mathrm{Y}_{6}=$ |  |
| - $\mathrm{Y}^{\text {\% }}=$ |  |

- Press 2nd then graph to pull up the table of points.

| $X$ | $Y_{1}$ | $Y_{2}$ |
| :--- | :--- | :--- |
| 0 | 7 | 1 |
| 1 | 6 | 3 |
| 2 | 5 | 5 |
| 3 | 4 | 7 |
| 4 | 3 | 9 |
| 5 | 2 | 11 |

- Scroll through the table using the navigation arrow keys and look for entries with the same $Y_{1}$ and $Y_{2}$ values. These are the location(s) of the intersection(s).
- If there is no entry with the same $Y_{1}$ and $Y_{2}$ values, there is either no solution or the solution is not a whole number. If either situation exists, use the graphing method discussed earlier or the matrix method discussed in the next section.

Solution:
$x=2 \quad y=5$

## Solving using a matrix

Another method for solving a system of equations involves putting equations into an augmented matrix. An augmented matrix is a rectangular array of numbers where each row
represents a different equation, and each column represents the coefficient of each variable with the last column listing the solutions. Matrices can be used to solve systems of equations with two or more variables. For more information on matrices, refer to the Solving Systems of Linear Equations Using Matrices handout.

- Write the system of equations as an augmented matrix.
- Arrange the equations so all variables are on the left of the equal sign and constants are on the right. The variables should be in the same order for each equation.

$$
\left\{\begin{array} { c } 
{ x + 5 z = y - 6 } \\
{ - z = - 3 x - 3 y + 1 0 } \\
{ x + 3 y + 2 z = 5 }
\end{array} \longrightarrow \left\{\begin{array}{c}
x-y+5 z=-6 \\
3 x+3 y-z=10 \\
x+3 y+2 z=5
\end{array}\right.\right.
$$

- Create the matrix by taking the coefficient of each variable and entering them into each row with the last column representing the constants. Use a 0 if a variable is missing from one of the equations.

$$
\left[\begin{array}{cccc}
1 & -1 & 5 & -6 \\
3 & 3 & -1 & 10 \\
1 & 3 & 2 & 5
\end{array}\right]
$$

- On the calculator, press $2 n d$ then $\mathbf{x}^{\mathbf{- 1}}$ to pull up the matrices window.

```
NAMES MATH EDIT
1:[A]
2:[B]
3:[C]
4: [D]
5: [E]
6:[F]
7:[G]
```

- Use the right arrow key to navigate to the "EDIT" menu.
- Select the matrix to be edited and press the enter button. For this example, the first matrix, " $1:[\mathrm{A}]$, " is selected.

| NAMES MATH EDIT |
| :--- |
| 1:[A] |
| 2:[B] |
| $3:[C]$ |
| $4:[D]$ |
| b:[E] |
| s:[F] |
| $7:[\mathrm{G}]$ |

- Type in the matrix size. The size is the number of rows by the number of columns. For example, this system of equations creates a 3 by 4 matrix.

- Using the navigation arrow keys, move to the first entry of the matrix. Fill out the matrix by typing in the corresponding values for each place and pressing enter after each value.

| MATRIX[A] | $3 \times 4$ |  |
| :---: | :---: | :---: | :---: |
| $\left[\begin{array}{llll}1 & -1 & 5 & -6 \\ 3 & 3 & -1 & 10 \\ 1 & 3 & 2 & 5\end{array}\right]$ |  |  |

- Press $\mathbf{2 n d}$ then mode to return to the home window.
- Press $\mathbf{2 n d}$ then $\mathbf{x}^{\mathbf{1}}$ and use the right arrow to navigate to the "MATH" menu.
- Scroll down and select "B: rref(," then press enter.

```
NAMES MATH EDIT
8个Matrlist
9:List>matr(
0: cumSum(
A: ref
B:rref
C: rowSwap (
```

- Press $\mathbf{2 n d}$ then $\mathbf{x}^{\mathbf{- 1}}$ and select " 1 : [A]" from the "NAMES" menu.
- Press enter to display the reduced matrix. Convert the matrix back to equation form to determine the solution.
